

member mounted on the second handle for selective engagement of the second latch with the first latch to hold the interface device in the first configuration.

10. A device as recited in claim 9 wherein the release means comprises:

- a cantilever extending from the second end of the first handle toward the second end of the second handle; and
- a tab formed at the end of the cantilever, wherein the first latch member is mounted on the tab and the cantilever is biased to engage the first latch member with the second latch member, and wherein the tab can be pulled to disengage the first latch member from the second latch member to move the device into its second configuration.

11. A device as recited in claim 8 further comprising a pair of wing arms mounted on the first side of the base member and located diametrically across the orifice from the pivot posts, wherein the wing arms respectively extend from the base member in opposite tangential directions from each other, wherein each wing arm is formed with a protrusion and each handle is formed with a slot having a hole for receiving a respective protrusion therein for interaction therewith to limit separation of the handles when the device is in the second configuration.

12. A device as recited in claim 11 further comprising:
